

1 Errata Summary

After the publication of the manuscript, it was found that the normalization of certain signals in the final limit plots were incorrect. This was found to originate from the incorrect cross section scale factors used in the limit calculation for several signal masses. Specifically, this impacted five signal masses in the lepton-triggered channel, including three axion-like-particle (ALP) masses (0.1, 1, and 10 GeV) and two dark-photon interpretations with Dark Higgs and scalar masses $[m_H, m_{Z_d}]$ of $[125 \text{ GeV}, 5 \text{ GeV}]$ and $[400 \text{ GeV}, 200 \text{ GeV}]$. For the ALP masses, the 0.1, 1, and 10 GeV masses were scaled by 3.1222, 3.1158, and 2.8713, respectively, when they should have been scaled by a uniform 2.003. This impacts paper Figures 15 and 16, shown here after applying the modification. For the two dark photon masses, their cross sections both were scaled a factor of ten too large, producing limits an order of magnitude weaker than the correct values. This impacted two of the limits shown in Figure 18, with the updated version included below.

Figure 15: Summary of the limits for the Z+ALP model. (a) Comparison between observed and expected 95% CL upper limits on the Z+ALP production cross-section $\sigma \times B_{a \rightarrow gg}$ for $m_a = 40 \text{ GeV}$. (b) Observed 95% CL upper limits on $\sigma \times B_{a \rightarrow gg}$ for all considered ALP mass points.

Figure 16: Comparison of the expected and observed 95% CL upper limits on the Z+ALP production cross-section for (a) $m_a = 0.1, 1$, and 10 GeV and the one of Ref. [58] and for (b) $m_a = 40$ GeV which is also covered in Ref. [59]. The observed limits are consistent with the expected ones within the uncertainties.

Figure 18: Observed 95% CL upper limits on the $\sigma \times B_{Z_d \rightarrow f f}$ production cross-section for dark photon Z_d benchmark samples. The observed limits are consistent with the expected ones within the uncertainties.
